Catalog options summary

- *Document and enrich metadata:* edit descriptions, aliases, custom fields, and glossary links.
- *Use source comments:* import table/view/column comments from Oracle.
- *Model relationships visually:* import PK/FK/unique keys and build ER diagrams in subject areas.
- *Apply governance features:* use profiling, quality checks, lookups, and classification.
- *Track and share changes:* sync description updates and publish documentation to Portal/exports.

Database links

The Oracle Connector imports **Database Links** as **Linked Sources**, capturing the connection details and assigned names.

 ASSOCIATION OF LINKED SOURCES

The import process **does not automatically associate linked sources with specific objects**. Users must manually assign the linked source to the desired objects.

If a view is created using a **Database Link** connection object, the linked server must be assigned, and the script parsed to establish **data lineage**.

How to connect

Use the step-by-step connection guide for full Portal and Desktop instructions, prerequisites, and import

>

Relationships and diagrams		PK/FK/unique keys imported and used in ER diagrams	Keys must exist in source schema
Automatic lineage		Object-level and column-level (parser dependent) for views, materialized views, procedures, and functions	See Required access level
Data profiling and quality		Profiling, quality checks, and classification workflows	See Required access level
Write-back comments		Selected object types	See Required access level

Imported objects

Object	Imported as
Table	Table
View	View
Materialized view	View
Procedure	Procedure
Package	Package

Column comments/descriptions

Lineage support

Source	Method	Supported
Views	From dependencies	
Views	From SQL parsing	
Views (column level)	From SQL parsing	

Source	Method	Supported
Materialized views, procedures, functions	SQL parser dependent	✓

Data profiling

Profile	Support
Table row count	✓
Table sample data	✓
Column distribution (unique, non-unique, null, empty values)	✓

Not supported or limited

Not supported / Limited	Workaround
Check constraints	Add manual documentation
Non-unique indexes	Document important indexes manually
Automatic object mapping for database links	Assign linked source manually before parsing SQL

Supported versions and editions

Supported Versions	Supported Editions
9i R1, 9i R2, 10g R1, 10g R2, 11g R1, 11g R2, 12c R1, 12c R2, 18c, 19c, 21c, 23c	Express, Standard, Enterprise

Required access level

Importing database objects requires Oracle access for the account used in *Import objects from database*.

Permission / access	Used for	If missing
	Establishing connection and	Connection and import

Dataedo does not alter source data during synchronization.

The following objects are accessed during import. If access is missing, the import impact is:

Oracle object/view	What will be missing in import without access
ALL_ARGUMENTS	Procedure/function argument metadata (input/output parameters and signatures)
ALL_CONSTRAINTS	Constraint definitions (PK/FK/unique/check metadata), relationship backbone
ALL_CONS_COLUMNS	Column-level mapping for constraints; PK/FK/unique column assignments
ALL_DB_LINKS	Database links import (Linked Sources)

Oracle object/view	What will be missing in import without access
ALL_INDEXES	Index metadata (index objects, type, properties)
ALL_IND_COLUMNS	Column-level index composition
ALL_OBJECTS	Object discovery baseline; some objects may not be detected at all
ALL_SCHEDULER_JOBS	Job/task metadata
ALL_SEQUENCES	Sequence objects and sequence metadata
ALL_SOURCE	Source code/definitions for procedures, functions, packages, triggers; parser input
