

Metadata scanning overview

Types of connectors

Native connectors

Dataedo is shipped with a number of native connectors that can connect to specific technologies: database applications, BI tools, ETL tools, etc., and extract metadata.

Custom SQL Connectors (from 23.2)

In version 23.2, we are unveiling a mechanism that allows for the creation of custom connectors for data sources that support SQL and extract metadata with data dictionary tables (supported by most relational databases). These custom connectors are delineated through a series of predefined SQL queries that extract metadata.

Furthermore, these connectors have the capability to support data profiling, reference data, and primary key/foreign key tester functionalities.

As of now, the custom connectors are crafted exclusively by the Dataedo team. However, we are working towards empowering users to create their own custom connectors in forthcoming updates.

Metadata import with interface tables

Dataedo provides a powerful feature that allows users to import various metadata into the catalog using **interface tables** - a set of predefined tables where users can upload metadata extracted on their own and an import that loads it safely into the repository.

Calling APIs

Some data sources provide APIs that deliver metadata.

Sampling documents

Sources like document stores (MongoDB, for instance) require sampling of documents to identify their structure.

Parsing report/ETL code

To extract metadata from BI or ETL tools, Dataedo needs to parse the code of reports and packages.

SQL Parsing

To build lineage for SQL code, Dataedo parses SQL to identify objects used, their columns, and data movement.

[Learn more about SQL parsing](#)

Data profiling

To extract information about column data profiles (min-max, average, number of nulls, etc.), Dataedo executes a number of predefined data profiling SQL queries.

- Apache Parquet
- Azure Analysis Services Tabular
- Azure Blob Storage
- CSV/Delimited Text File
- Db2
- Delta Lake
- FTP/SFTP
- JSON
- Local File
- Microsoft Excel
- ODBC
- SQL Server Analysis Services (SSAS) Multidimensional (Cubes)

- SQL Server Analysis Services (SSAS) Tabular
- SQL Server Integration Services (SSIS)
- Vertica
- XML

Also, the following connectors have limited functionality when [Dataedo Agent](#) is installed on Docker/Linux:

- Connectors that rely on file system access (e.g., dbt Core, DDL import, OpenAPI/Swagger, etc.) may have issues with accessing the required files.
- SQL Server Reporting Services (SSRS) - only Standard Authentication is supported.

Connectors configurable through Dataedo Portal
